

Akaunting DevOps Case Study

Read Me

We aim to evaluate your level of competency for crafting some critical tasks as a DevOps at Akaunting. The case study consists of 2 independent tasks and we'll expect the candidate to have worked on all of them. Feel free to ask any questions.

All outputs for the tasks should be in English.

Enjoy the challenges!

Task 1

Can you create a private GitHub repository which includes a GitHub Action/Workflow? The action should automate the build, test, and deployment of a simple PHP code to a DigitalOcean LAMP/LEMP server. You can share the repository with the **github.com/denisdulici** account.

Task 2

Which SDLC methodology would you choose for Akaunting and its apps/modules? Everything is hosted on GitHub.
